

**The Most Liquid
Exchange on PulseChain**

PulseX sacrifice phase is now live, don't miss out! Go to PulseX.com

PulseX is PulseChain's Exchange

PulseX enables you to exchange tokens ("PRC20s") on PulseChain for one another. For example, you could swap PulseChain's native token PLS for PulseX's token PLSX. It works like Uniswap on Ethereum. Bridges also let people trade currencies from other chains on PulseX.

The World's Largest Yield Farm

Every time people swap from one coin to another on PulseX, liquidity providers earn fees as a reward. Users can bridge in their free ERC20s and pair them with free PRC20s to provide liquidity and earn fees. This also backs the value of the PRC20s that they got for free.

The PulseX Second Incentive Token

In order to enhance PulseX's success, another token will exist to further incentivize liquidity providers beyond the fees they're already making. When they become named liquidity providers, they will receive LP tokens that they can deposit into a yield farm. This not yet vetted token is emitted with decreasing inflation over time. A DAO chooses which trading pairs receive this incentive and at what rates. Only addresses with PLSX balances get to vote in the DAO.

PulseX's Goal

PulseX is a Uniswap fork with PLSX Liquidity Provider incentivization. Its goal is to provide PulseChain users with the best trading experience & yield farm with a strong focus on incentivizing ERC20 holders to bridge in and back the value of their free PRC20s.

PLSX is designed to increase in value.

The Best Asset Class in History

Cryptocurrencies have outperformed every other asset class over the last 10 years. There's a reason for that: they remove counterparty risk and middlemen, allow for privacy, have better uptime than your bank and credit card network. Cryptocurrencies allow for a better way to login to things; they can work as cryptographic username & password pairs, independent of platforms.

High Yields

You can provide the PLS or PRC20s that you hold as liquidity to PulseX and earn yield on them. This is less risky than trading and allows you to earn predictable income on your crypto. Cryptocurrencies have the highest yields in the world, far exceeding those of other asset classes.

The Most Transparent Trading in the World

Not only can you see on-chain what addresses trade which assets, you can also see transparently which addresses sold, bought, and how much money it has left to buy more.

Efficiency

With Bitcoin you need from minutes to hours until a transaction confirms and transacting costs you multiple USD in fees; transacting on PulseChain costs less than \$0.01 and confirmations happen in about 3 seconds. PulseX utilizes this network to allow for fast & cheap swaps between PLS and PRC20s.

PLSX Only Becomes More Rare

PulseX has lower fees than most competing exchanges. The fee to users is lower than on most competing exchanges. Most tokens inflate at high rates while PLSX never inflates. The supply only becomes more rare as 21% of all fees could be used to buy up the price and burn the freshly bought PLSX. PulseX is awesome Trading fees? Dirt cheap.

PulseX will have a 0.29% fee that users pay on every swap. That is less than Sushiswap, Trader Joe's, Quickswap and Uniswap. 76% of all trading fees could be distributed to Liquidity Providers. 21% could be used to buy and burn PLSX, reducing its supply over time. 0.01% of a trade's value goes to an address you must have no expectations of.

PulseX Will Have the Most Liquidity on PulseChain

The initial liquidity for PulseX comes from a bot called the "AMM ratio fixer bot". It harvests over around 99% of many coins liquidity from Uniswap, Sushiswap and other popular markets at launch, then recreates those pairs on PulseX and adds the liquidity. As users want the best deals for their trades, they tend to go where the liquidity is the largest. That creates volume. As liquidity providers make profit on volume, they are likely to deposit on the exchange with the most volume. It is hard for new competitors to overcome the critical mass of so much liquidity in one place.

It's Good to Have All the Liquidity in a Single Place

Centralized liquidity means the best deals for users because it results in low slippage. Meaning the price moves against them less when they swap. It also means that fewer arbitrage bots become rich equalizing the prices from different liquidity sources. It's more efficient.

Summary

PulseX has lower fees, the most liquidity on the PulseChain and only becomes more rare.
